

PROJECT STORY 01

The Goddery - a bold identity, a familiar way to shop

A distinctive brand needs a shopping experience people can understand immediately. The Goddery's brief brought a cinematic, Viking-inspired identity to an independent supplement store, with clear product information and straightforward browsing on smaller screens.

The approach was to carry that identity through navigation, merchandising and product pages while using Shopify for the underlying commerce. The brand could be expressive without making the basic shopping steps unfamiliar.

The build includes a custom responsive Shopify theme, goal-led product browsing, structured supplement information, a cart drawer and app-style mobile navigation. Editable sections allow the merchant to manage routine content changes through Shopify.

What it enables: a recognisable storefront with familiar shopping interactions and merchant-managed content.

The product lesson: visual identity and everyday usability need to be designed together. A custom theme can shape the experience around a business while retaining an established commerce platform.

PROJECT STORY 02

Bookivo - the booking journey continues behind the calendar

For a service business, an appointment sits inside a working day. Availability depends on the team, the service and the information needed before the customer arrives. Bookivo brings that operational context into the booking experience.

The platform connects branded booking websites with team calendars, staff rotas, service durations, consultation forms and payment rules. Deposits and payments, automated reminders and customer rescheduling sit within the same overall journey.

Customers can discover a business and book under its own brand. The team can manage appointments and availability in the same platform, with the booking flow connected to the details behind each service.

What it enables: a joined-up route from discovering a service to arranging and managing an appointment.

The product lesson: planning a booking system means understanding how the business actually works. The visible calendar is one part of that wider workflow.

PROJECT STORY 03

Aevum Healthcare - connecting the catalogue and member experience

Aevum Healthcare brings a research-product catalogue and member functionality into one bespoke experience. The portfolio describes a clean, considered interface with product browsing, member checkout and an installable member app.

The project story centres on the relationship between those parts. Visitors need to understand the catalogue, while members need a clear route into the functions available to them. Keeping those journeys coherent is an important product-design consideration.

The delivered platform combines the catalogue, member checkout and installable app experience rather than treating each as an unrelated destination.

What it enables: product discovery and member interactions within one platform.

The product lesson: a catalogue project can involve more than presenting products. Access, navigation and the member experience need to be considered together.

Evidence boundary: the public portfolio provides the feature summary above, but does not document the original client brief or measured outcomes. The design considerations in this story are editorial interpretation, not a quoted client requirement.

PROJECT STORY 04

Kratos Dominion - designing the journey into a private platform

Kratos Dominion is a private membership platform for educational resources and community updates. Its public portfolio description highlights a distinctive dark identity, member sign-in and a referral-led access journey.

This gives the story a clear focus: how a person moves from discovering a private platform to accessing its member experience. The entry journey is part of the product, alongside the resources available after sign-in.

The build brings branded presentation, member access and community-oriented content into a bespoke platform.

What it enables: a defined route into a private member environment for resources and updates.

The product lesson: membership projects need early decisions about who can join, how access works and what members should find once inside. These are useful questions to explore before choosing screens or features.

Evidence boundary: the public portfolio confirms the features above. It does not establish member numbers, engagement results, security certifications or the reasons behind every design decision. The broader product lesson is editorial interpretation.

PROJECT STORY 05

Witness Wise - making specialist services easier to understand

Witness Wise brings statement taking, translation, interpreting and people tracing together on a professional services website, with clear routes to enquire.

The story is about organising a varied service offering. A visitor may arrive with one specific need, so a useful service website needs to help them recognise the relevant service and understand the next step.

The portfolio describes a website that presents these legal support services together and connects that information to enquiry routes.

What it enables: a public place to explore the business's services and make an enquiry.

The product lesson: for professional services, deciding how to explain and organise the offer is part of the website work. Page structure and enquiry journeys deserve attention alongside visual design.

Evidence boundary: the service list and enquiry functionality are confirmed by the public portfolio. The discussion of visitor needs is editorial interpretation; no conversion increase, client acquisition result or legal-service outcome has been measured here.

Source: SilentCPO public portfolio, src/lib/projects.ts. Prepared 29 September 2026. No measured commercial outcomes are documented. Do not invent statistics, testimonials, delivery times or pricing. Keep the studio founder anonymous.

PROJECT STORY 06

Vialo - bringing schedules and supplies into one daily view

Schedules, stock counts, supply calculations and supplier details can become scattered across notes. Vialo's product brief connected these tasks in a responsive personal tracking app.

The approach links what is scheduled with what is in stock. Colour-coded records and a focused dashboard help make the information easier to scan on a phone or desktop.

The build includes a weekly schedule, daily completion ticks, inventory counts, supply estimates, low-stock alerts, supplier reorder shortcuts and an on-demand AI reference agent.

What it enables: one place to record a personal routine and keep track of supplies.

The product lesson: when related tasks share information, designing them together can create a more coherent experience than keeping them in separate notes or tools. AI is one supporting feature within that wider workflow.

Content boundary: describe the software and its organisation features only. Do not turn this story into medical advice, dosing guidance, treatment recommendations or claims about health outcomes. The AI reference feature is not evidence of clinical accuracy or medical validation.

Source: SilentCPO public portfolio, src/lib/projects.ts. Prepared 29 September 2026. No measured commercial outcomes are documented. Do not invent statistics, testimonials, delivery times or pricing. Keep the studio founder anonymous.
